1. Introduction

Sharing folders in Ubuntu is a useful tool to facilitate access to files between different users or multiple devices within a local network. This feature allows users to easily share data, which enhances collaboration and facilitates the exchange of information.

2. Objectives:

1 .Facilitate cooperation:

- Enable users to work together on joint projects by sharing files easily.

2 .Save time:

- Minimise the need to transfer files via other means such as USB or email, saving time and effort.

3 .Centralised access:

- Facilitate access to data from multiple devices on the same network, which facilitates file management.

4 .Optimise security:

-Provide permission control options, allowing to determine who can access files and folders.

5 .Increase productivity:

-Optimise the workflow through quick and easy access to necessary information.

6 .Enhance learning:

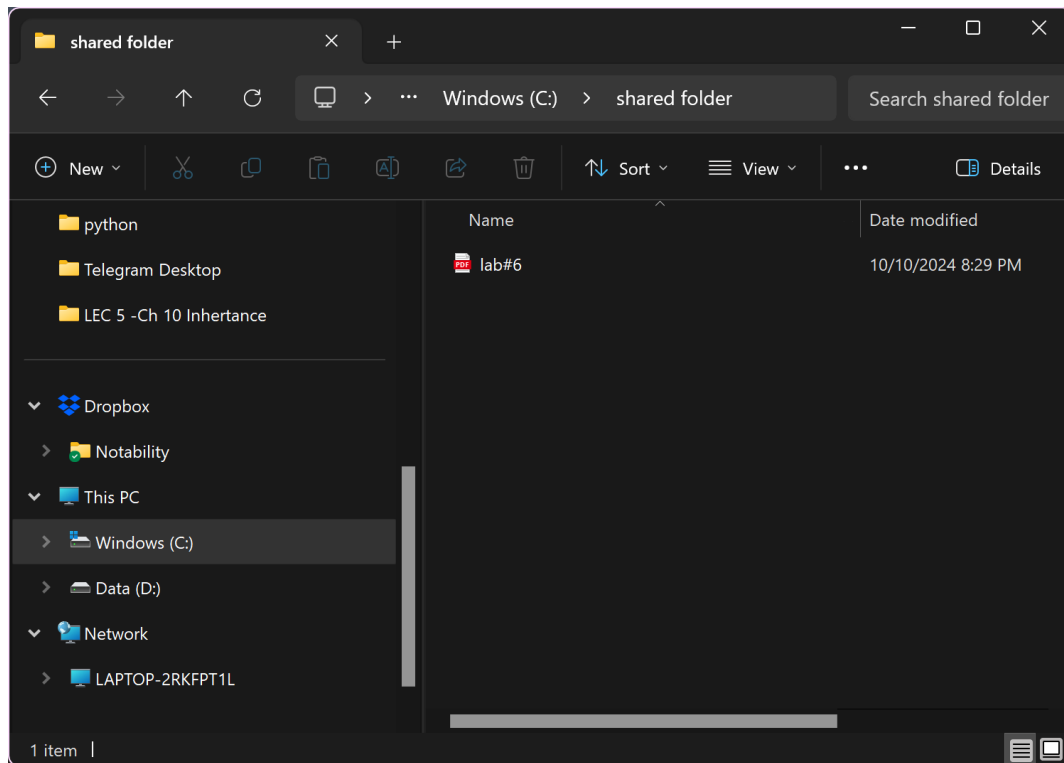

-Providing an opportunity for new users to learn how to deal with different systems and set up networks.

7 .Joint venture support:

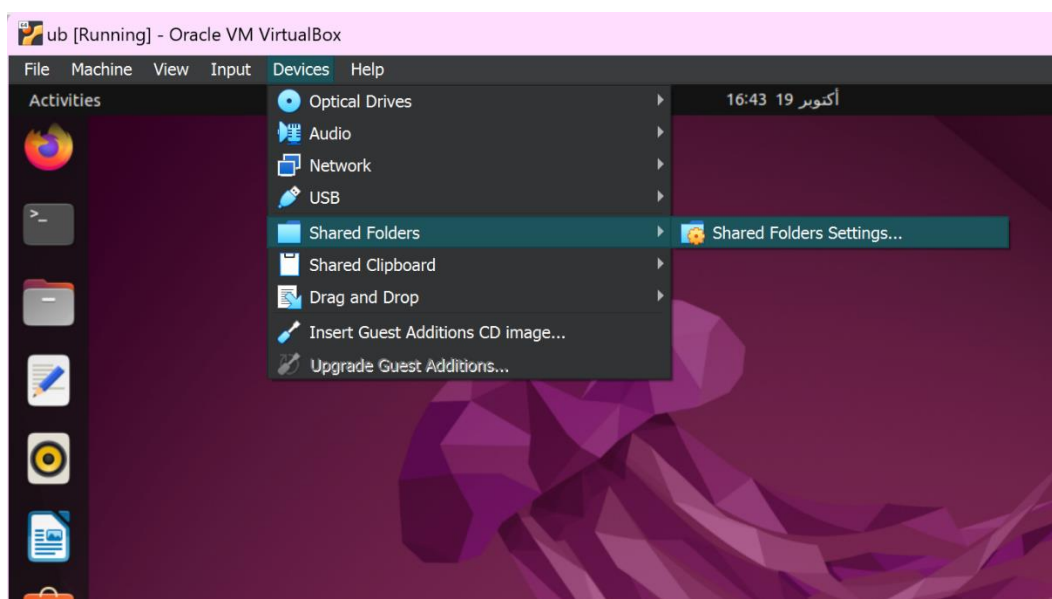

-Facilitate work on group projects by providing a common environment for storing and sharing files.

1: The steps shown in the images relate to sharing a folder between Windows and Ubuntu using VirtualBox:

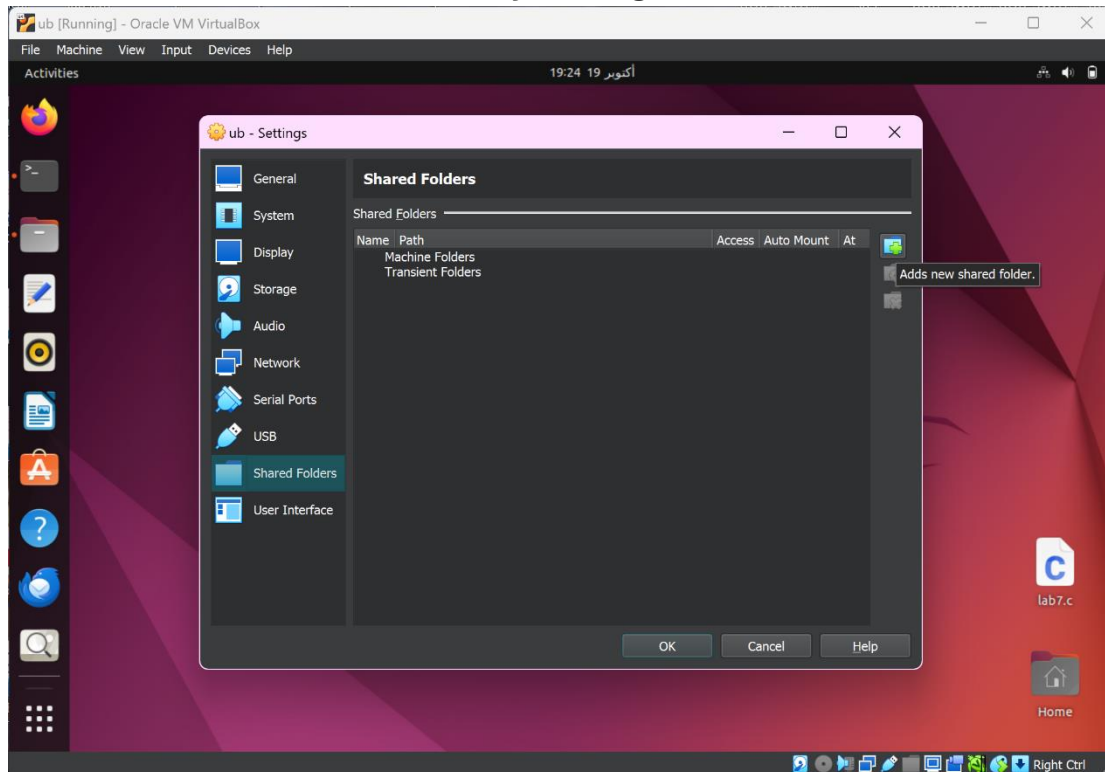

Step 1: This shows a folder in Windows containing a PDF file named "lab#6.pdf" in a shared folder called "shared folder" The file is visible inside the folder.

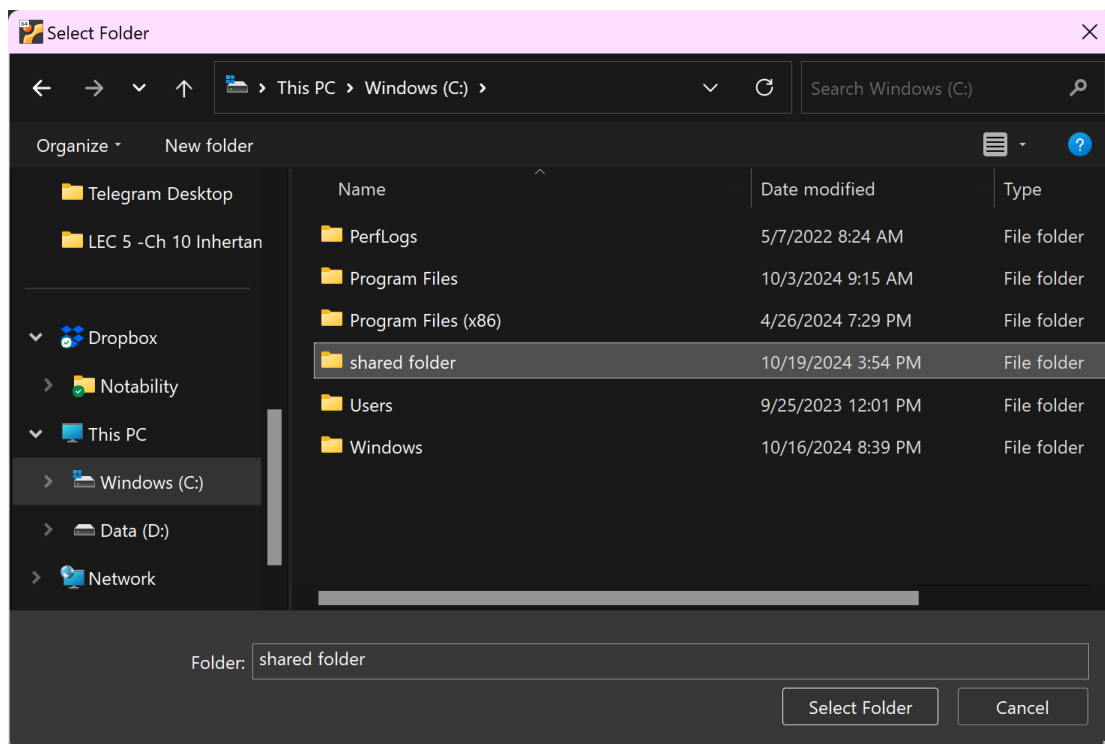

Step 2: The "Devices" menu is open, and the "Shared Folders" option is selected.

Step 3: The "Adds new shared folder" option is selecte, indicating that the user can add a new shared folder by clicking on it.

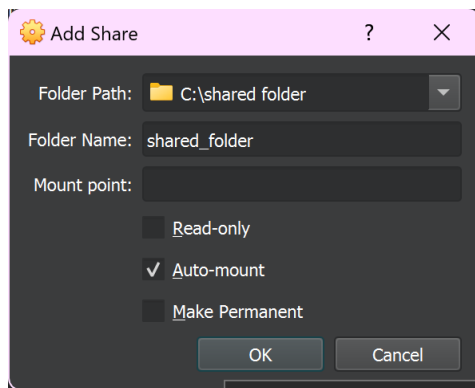

Step 4: In"Folder Path" select The “Other...” option in the drop-down menu and select a share_folder. down m enu and select a e

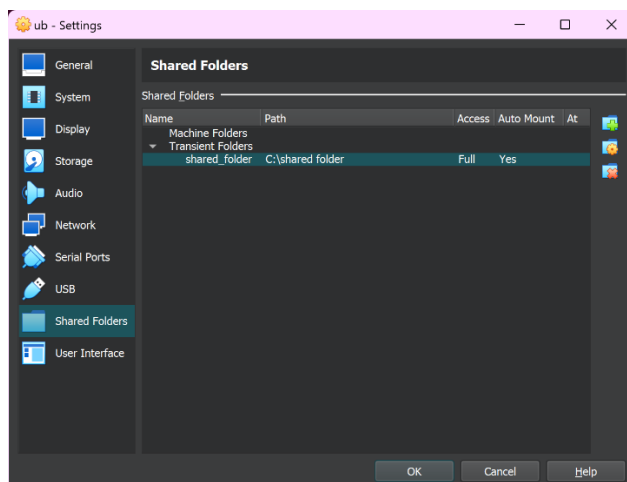

Step 5:

1. The "Folder Path" is set to "C:\shared folder", indicating that the new shared folder will be created in the C drive.
2. The "Folder Name" is set to "shared_folder", which will be the name of the new shared folder.
3. The "Mount point" options include "Read-only", "Auto-mount", and "Make Permanent". The "Auto-mount" option is selected, meaning the shared folder will be automatically mounted when the virtual machine starts.
4. The "OK" button will create the new shared folder with the specified settings.

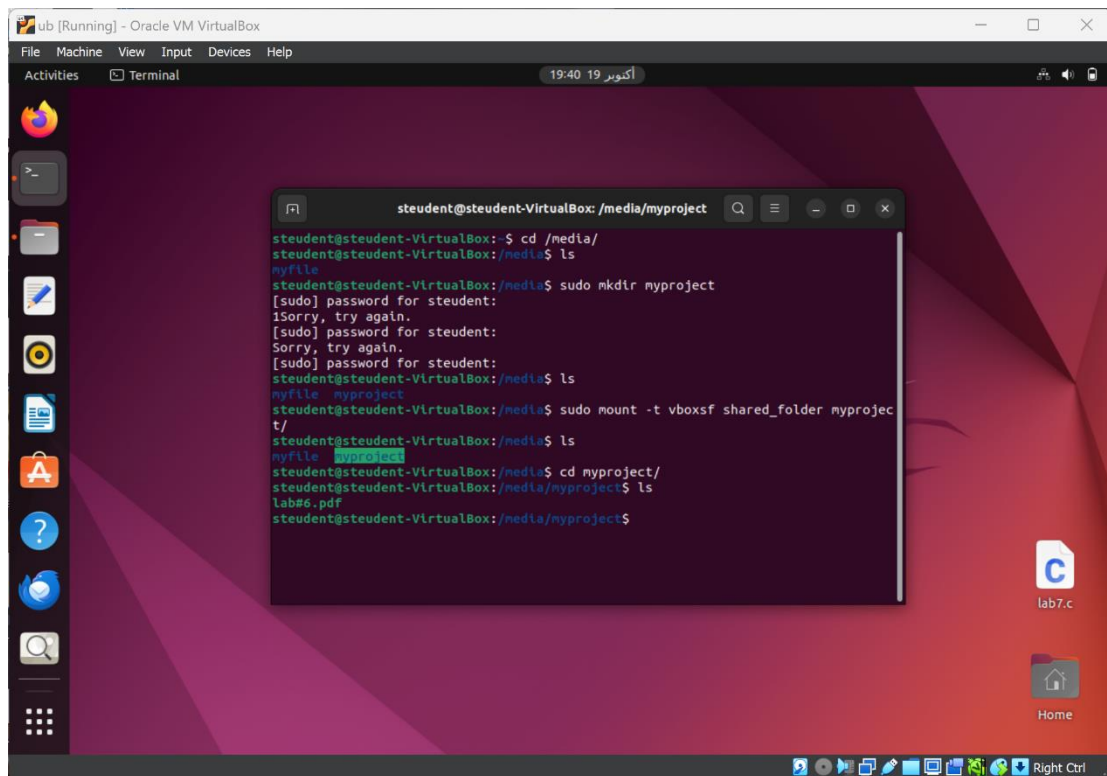

Step 6:

1. The "Shared Folders" section displays the configured shared folders between the host and virtual machine.
2. The shared folder named "shared_folder" is listed, with the path "C:\shared folder" and the access set to "Full" of "Auto-mount" enabled.
3. The "Machine Folders" and "Transient Folders" options allow the user to manage different types of shared folders. The buttons at the bottom of the window allow the user to apply the settings ("OK").

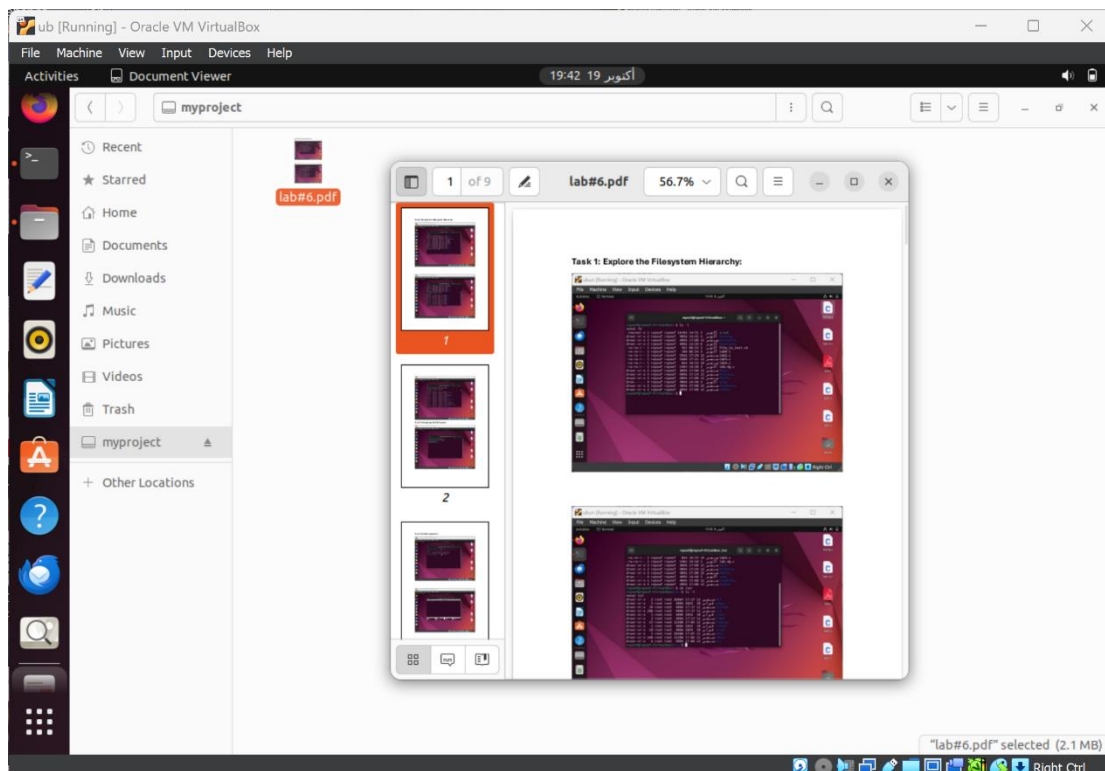

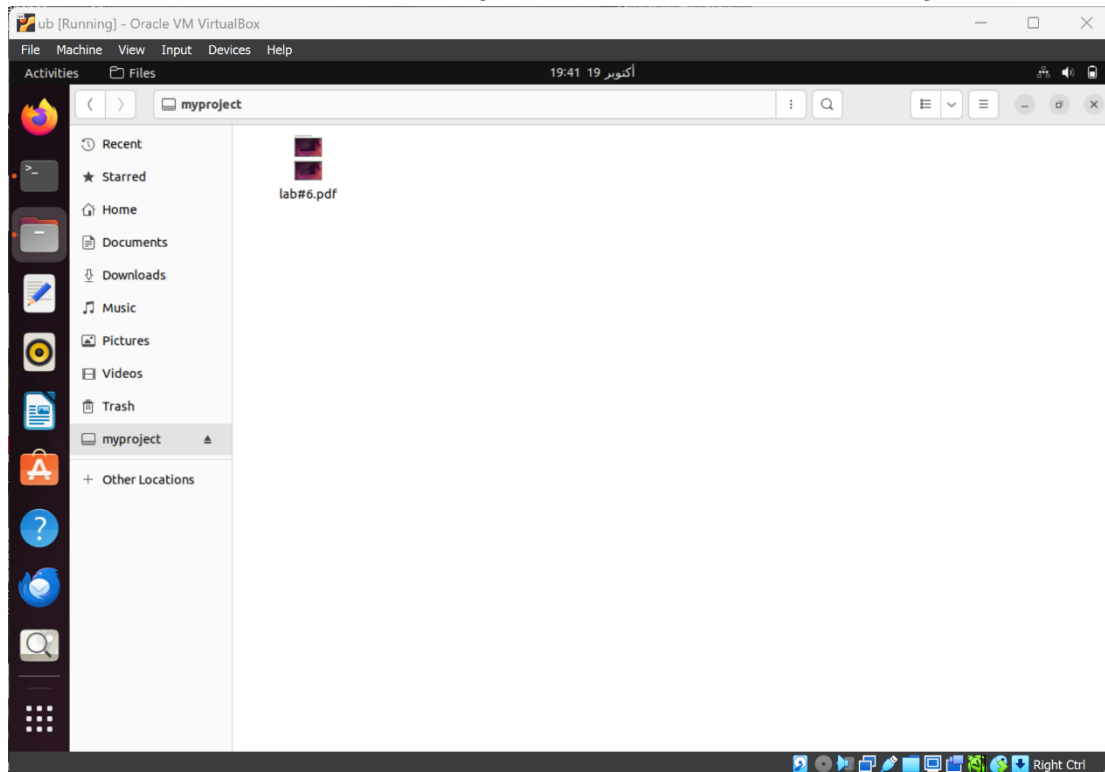

Step 7: The "Terminal "in Ubuntu is used to run several commands:

- The directory is changed to /media/ using the command [cd /media/].
- A new directory named myproject is created using the command [sudo mkdir myproject].
- After entering the password, the command executes successfully.
- Then, the shared folder from Windows is mounted to the myproject directory using the command [sudo mount -t vboxsf shared_folder myprojec].
- After successfully mounting, the file "lab#6.pdf" from the shared folder is visible in the myproject folder when running the [ls] command inside myproject.

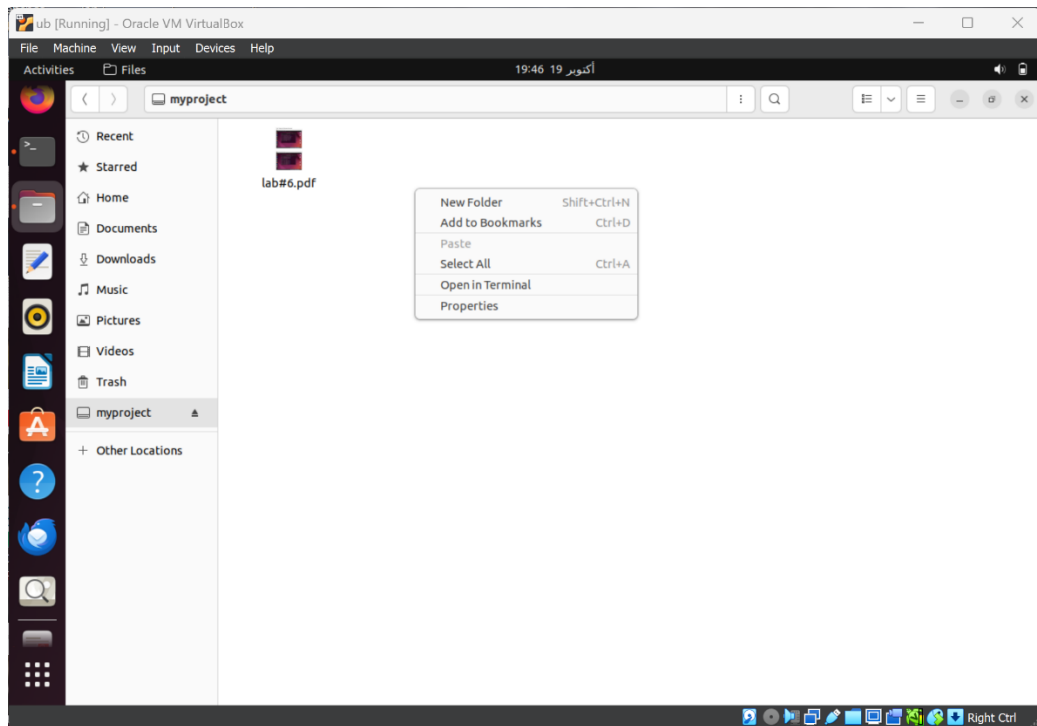

```
steudent@steudent-VirtualBox: /media/myproject
steudent@steudent-VirtualBox:~$ cd /media/
steudent@steudent-VirtualBox:/media$ ls
myfile
steudent@steudent-VirtualBox:/media$ sudo mkdir myproject
[sudo] password for steudent:
Sorry, try again.
[sudo] password for steudent:
Sorry, try again.
[sudo] password for steudent:
steudent@steudent-VirtualBox:/media$ ls
myfile  myproject
steudent@steudent-VirtualBox:/media$ sudo mount -t vboxsf shared_folder myprojec
t/
steudent@steudent-VirtualBox:/media$ ls
myfile  myproject
steudent@steudent-VirtualBox:/media$ cd myproject/
steudent@steudent-VirtualBox:/media/myproject$ ls
lab#6.pdf
steudent@steudent-VirtualBox:/media/myproject$
```

Step 8: A shared folder was set up between Windows and Ubuntu running inside VirtualBox. The file "lab#6.pdf" was accessed from both systems.

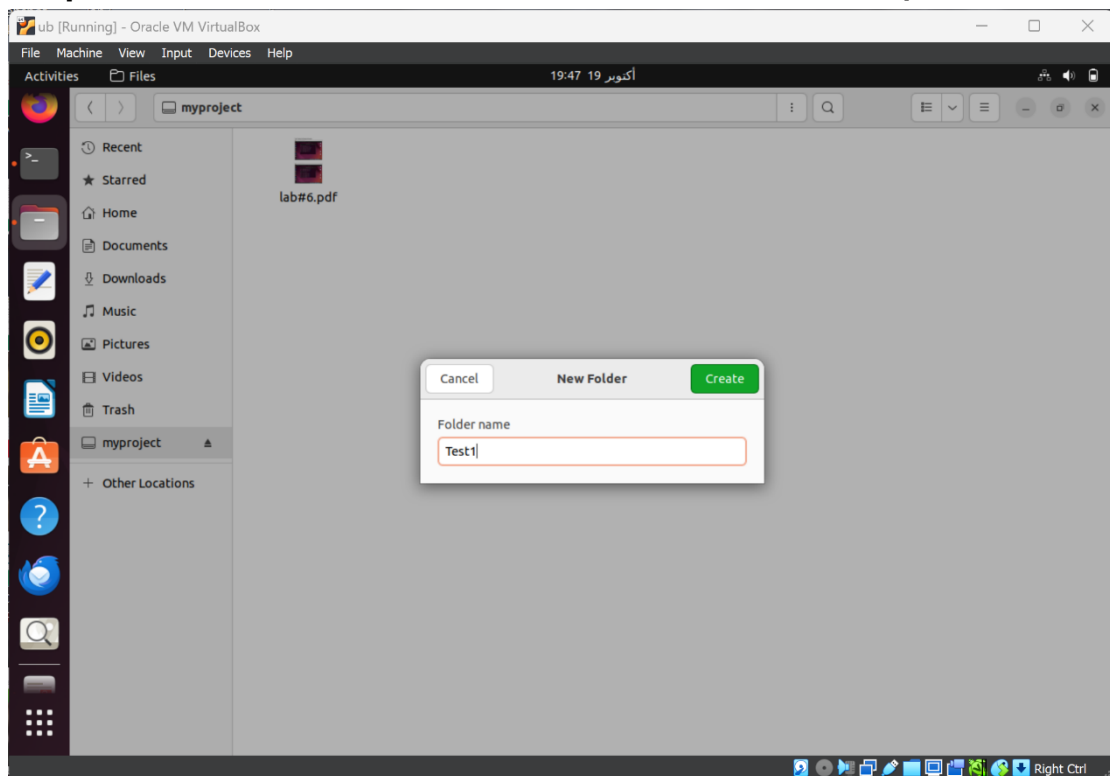

2: The steps shown in the images relate to sharing a folder between Ubuntu and Windows using VirtualBox:

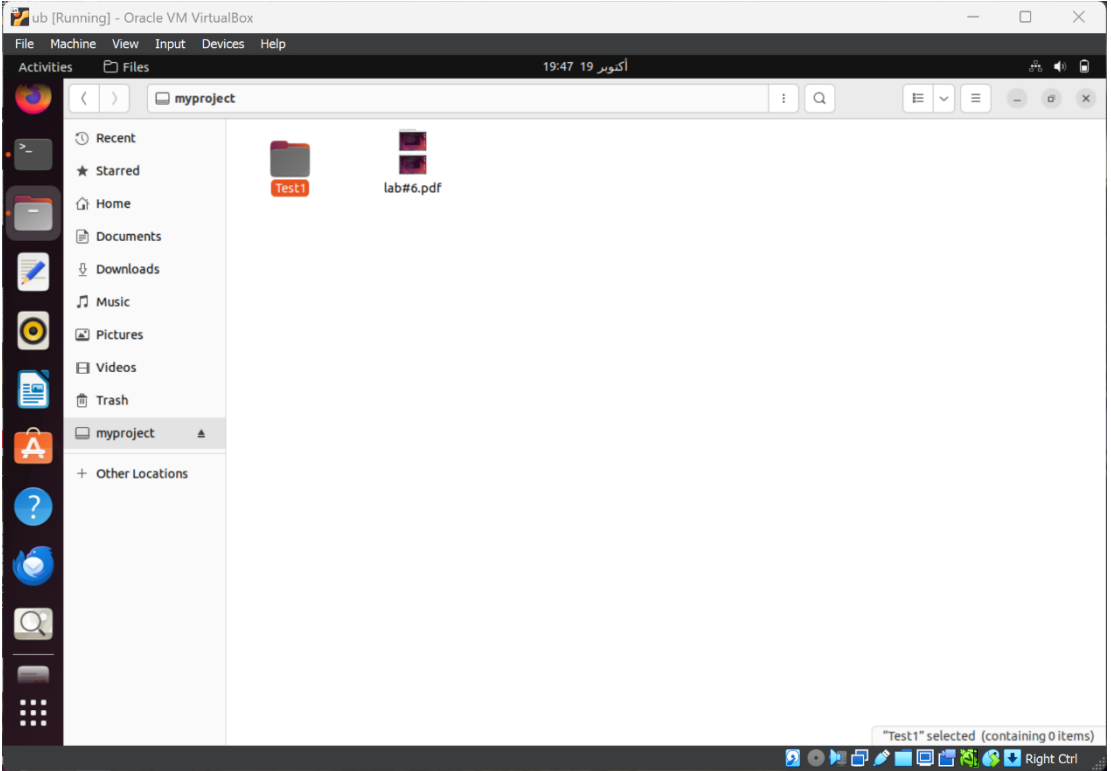

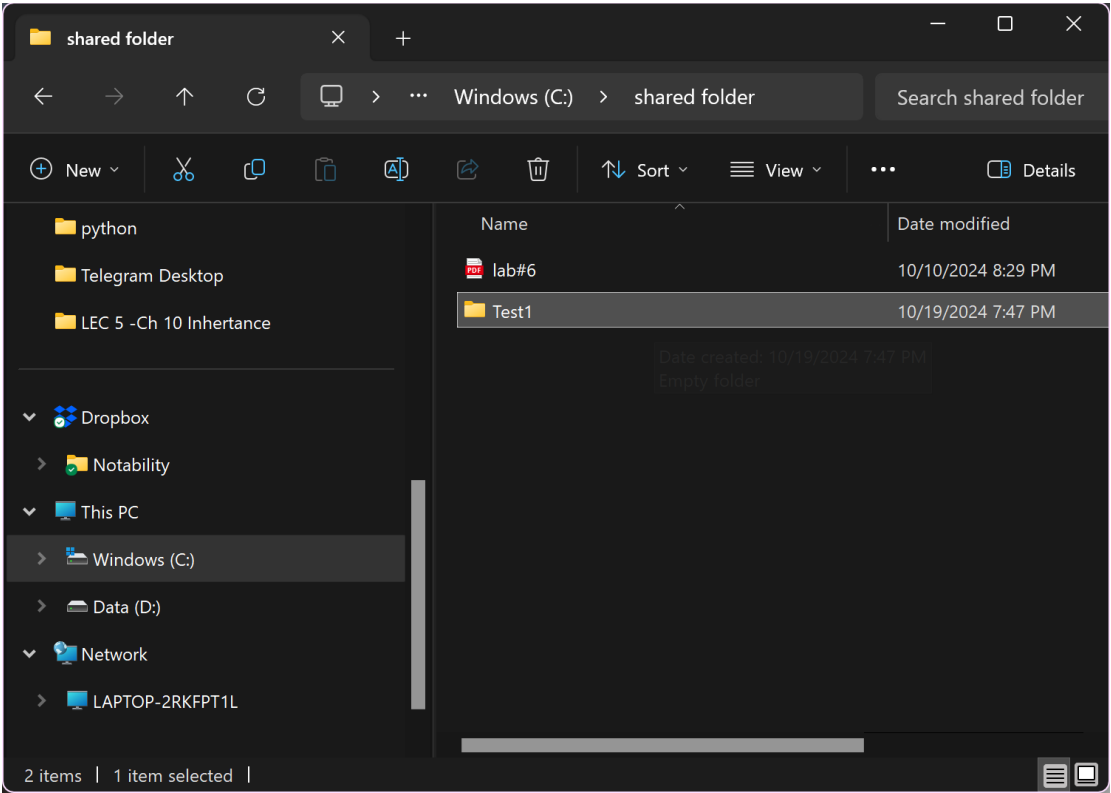

Step 1: The right-click menu in the image is selecte option creating a new folder.

Step 2: The user has entered the folder name "Test1" in the input field.

Step 3: A shared folder was set up between Ubuntu and Windows and running inside VirtualBox.The folder " Test1" was accessed from both systems.
